

Increase user productivity & deliver more value now! Implement agilesWorkflow in the first phase

Better organizational change management

An ERP implementation involves great change which can sometimes create anxiety and resistance amongst employees.

Certified for Microsoft Dynamics NAV agilesWorkflow guides the users through the organization's processes and their tasks, helping them to learn new procedures faster. It is critical that agilesWorkflow is implemented in the first phase so that employees are assisted through the implementation process and so that the overall training costs are reduced.

"When agilesWorkflow is implemented with Microsoft Dynamics NAV, it makes for a smoother implementation and helps to deliver greater value to our customers from the outset."

System integrity from day one

As users get used to a new system they will undoubtedly make mistakes. More things are done incorrectly in the first months of a new ERP system than in any time in the future but agilesWorkflow can help!

agilesWorkflow will guide the users through what they need to do and when, it will check mandatory fields, validate data, trigger approvals and ensure important checks are always done. With the agilesWorkflow notifications, even if things do go wrong the right person is always alerted immediately. It is critical to use master data workflows from day one to ensure data integrity and completeness of reporting, and to give a good base for the future.

Save overall implementation time and cost

When you implement agilesWorkflow in phase 1, you will get a more time and cost efficient project over the long-term. As you will invest time analyzing the business and designing processes as you implement NAV, including agilesWorkflow in the initial project will mean it is available to help handle and control these processes.

In some cases, it may add a little time to these workshops as you will dive deeper into tasks that NAV might not normally handle, however when agilesWorkflow is excluded, it will mean more time in a later phase revisiting and redesigning processes. Users especially do not want to learn how to use the ERP solution one way, only to have it changed in another way later down the track.

Reduce customization

With agilesWorkflow many customizations can be avoided. Every business is different and you are likely to have unique processes that cannot be adapted within any standard ERP solution without customization, but customization is costly and risky. You need a standard solution that can handle your unique processes without customization, that will make for a smoother and easier implementation, and a more scalable and upgradable solution. Using agilesWorkflow instead of customizations also means you can more quickly configure and manage changes in your business processes, without the need to always rely on your partner to do so.

Ensure you can reduce customization by implementing agilesWorkflow in phase 1.

Control your entire business from day one

When you implement agilesWorkflow in phase 1 you get more value upfront. Research shows that ERP systems on average handle only 30% of a business's processes. Including agilesWorkflow in phase 1 enables immediate control over some of the other 70% because with agilesWorkflow you can manage any kind of business process all within the Microsoft Dynamics NAV solution.
